```
The invention relates to an isolated peptide obtained from streptokinase, or its derivative or analog, which ameliorate cell death. The activity of peptides of the invention may be described as nootropic, neuroprotective, antiparkinsonian, anticonvulsant, cytostatic, antiparkinsonian, anticonvulsant, cytostatic, antiatherosolarotic, vasotropic, immunosuppressive, anti-HNO described as antiuler, antiparentic, reptides of the invention antiuloer, antibacterial and antiparasitic. Peptides of the invention antiuloer, antibacterial and antiparasitic. Peptides of the invention antiparasitic peptides of the invention are useful for treating comprising peptides of the invention are useful for treating neurodegenerative diseases (e.g. parkinson's, Altoeimer's, Huntington's disease and cerebellar degeneration) neoplastic disorders including cancer, inflammatory disorders (e.g. arthitis, inflammatory joint and myocardial reperfusion injury), immune diseases (e.g. heart failure, atherosolerosis and myocardial reperfusion injury), immune diseases (e.g. autoimmune diseases of systemic lupus erythematosus, diabetee mellitus, pernicious anaemia), myelodegenerative diseases, viral diseases, and degenerative diseases of any organ. Other disorders include macular degeneration, cataracts, croph, s diseases including bacteria, parasite, prion-based diseases, and accelerated aging. The current sequence repersents a streptokinase daring and any organ and allocation with an ability to ameliorate cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Streptokinase; cell death; apoptosis; necrosis; nootropic;

peptides or the invention may be described as, mostropic, antinflammatory, antiparkingonian, anticonvulant, cytostatic, antinflammatory, antiparkingonian, anticonvulant, cytostatic, antinflammatory, antiparkingonian, anticonvulant, cytostatic, antinflammatory, antidabetic, immunosuppressive, anti-HIV.

Comprision antibacterial and antiparasitic. Peptides of the invention are useful for treating comprising peptides of the invention are useful for treating comprising peptides of the invention are useful for treating neurodegenerative diseases (e.g. Parkinson's, Alzheimer's, Huntington's disease and cerebellar degeneration) neoplastic disorders including cancer, inflammatory disorders (e.g. heart failure, atherosclerosis and myocardial reperfusion injury), immune diseases (e.g. autoimmune constraint reperfusion injury), immune diseases (e.g. autoimmune constraint reperfusion injury), immune diseases (e.g. autoimmune constraint lugus erythematosus, diabetes melliturs, pernicious andemia), myelodegenerative diseases, viral diseases, viral diseases, viral diseases, und degenerative diseases, viral diseases, und degenerative diseases, und diseases, und diseases, und diseases, und diseases, und degeneration, cataracts, crohn's diseases, uncertaive colitis, cataracts, pancreatitis, infectious diseases including bacteria, parasite, prion-based diseases, and decelerated aging. The current sequence represents a streptokinase condering derived peptide of the invention with an ability to ameliorate cell
                                                                                                                                                                                                                                                                                                                             The invention relates to an isolated peptide obtained from streptokinase, or its derivative or analog, which ameliorate cell death. The activity of peptides of the invention may be described as, nootropic,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Streptokinase; cell death; amelioration; treatment; disease; aging; AIDS; cellular differentiation; physical insult; trauma; anoxia; hyperthermia; hypothermia; brain; spinal cord; kidney; heart; lung; llver; skin; HIV; viral disorder; hepatitis; retroviral; infection; encephalitis; FALS; neurodegenerative disorder; Parkinson's disease; Alzhelmer's disease; familial amyotrophic lateral sclerosas; atherosclerosis; heart failure; infarction; heart disease; crebellar degeneration; cardiovascular disease; infarction; heart disease; cardiomyopathy; hypertensive; myocardial; reperfusion injury; immune disease; rheumatoid arthritis; renal; retinal; systemic lupus erythematosus; insulin-dependent; diabetes mellitus; pernicious anaemia; dermatomyositis; enythema nodosum; myasthenia gravis; Sjogren's syndrome; temporal arthritis; autoimmune polyarthritides; Megener's granulomatosis; glomerulonephritis; anti-phospholipid syndrome;
                                                                                                                                                                            New peptides obtained from streptokinase, useful in ameliorating cell death due to apoptosis and/or necrosis and treating neurodegenerative, neoplastic, immune, cardiovascular and inflammatory disorders
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gape
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         .

Claim 6; Column 12; 15pp; English.

ANY SEGONS AT ANY SEGONS ARE NOVED PREDICTED BY CONTROL OF THE PRODUCTS of the invention and their encoding ameliorate cell death. The products of the invention and their encoding runcles acids may be useful for treating diseases and conditions related to aging, cellular differentiation, physical insult (e.g. physical and trauma, anoxia, hyperthermia, hypothermia, chemically induced damage, and trauma to the brain, spinal corders (e.g. hepatitis, retroviral and any other organ), viral disorders (e.g. hepatitis, retroviral infections, viral encephalitis, and AIDS/HIV), neurodegenerative disease, cerebellar degenerations, and familial amyotrophic lateral scalerosis (FALS)), cardiovascular disease, Alzheimer's disease, retroviral scalerosis (FALS), cardiovascular disease, antherosclerosis, corpertusion injury, and hypertenate disease (e.g. atherosclerosis, corpertusion injury, and hypertenate disease), immune disease (e.g. arberosclerosis) arbettes mellitus, lupus, pernicious anaemia, dermatomyositis, enythema cordesum, Sjognen's systemic lupus erythematosus, insulin-dependent, degener's granulomatosis, glomerulonephritis, anti-phospholipid syndrome, Wegener's granulomatosis, glomerulonephritis, anti-phospholipid syndrome, wegener's granulomatosis, glomerulonephritis, anti-phospholipid syndrome, breast, brain, colon, cervix, and prostate, Hodgkin's lupus, arcithomas, methomas, melanoma, cancers of the sarcomas, myelomas, arcithomas, menomas, melanoma, cancers of the corder organs, ischemia or reperfusion injury, renal ischemia or infarction, and stroke, toxic insult (e.g. luver toxicity, pulmonary toxicity, toxic damage to other corgans from chemicals, radiation, and other novious substances), macular chemicals, accelerated aginal cord issease (e.g. mycoracial incordines, accelerated aginal cord issease (e.g. mycoracial incordines, and demyclinating disease), bypass surgery, chemically, chemically, chemically, chemically, pulmonary conticity of and anthracyclines.

and anthracyclines.

Peptides that ameliorate cell death useful for treating conditions associated with cellular differentiation

Claim 7; Column 12; 15pp; English.

AMY25009-Y25019 are novel peptides derived from streptokinase that

ameliorate cell death. The products of the invention and their encoding

nucleic acids may be useful for treating diseases and conditions related

to aging, cellular differentiation, physical insult (e.g. physical

trauma, anoxia, hyperthermia, hypothermia, chemically induced damage,

and trauma to the brain, spinal cord, kidney, heart, lungs, liver, skin

and trauma to the brain, spinal cord, kidney, heart, lungs, liver, skin

and any other organ), viral disorders (e.g. hepatitis, retroviral

infections, viral encephalitis, and AIDS/HIV), neurodegenerative

disorders (e.g. Parkinson's disease, Alzheimer's disease, Huntington's

disorders (e.g. Parkinson's disease, Alzheimer's disease, Huntington's

clerosis (FALS)), cardiovascular disease (e.g. atherosclerosis

myocardial infarction, heart failure, cardiomyopathy, myocardial

repertualson injury, and hypertensive heart disease), immune disease (e.g.

repertualson injury, and hypertensive heart disease), immune disease (e.g.

repertualson injury, and hypertensive heart disease), immune disease (e.g.

repertualson injury, and hypertensive heart disease), immune disease (e.g.

repertualson injury, and hypertensive heart disease), immune disease (e.g.

repertualson systemic lupus servicious anaemia, dermatomyositis, enythema

nodosum, Sjogren's syndrome, temporal archritis, myasthenia gravis,

Wegener's granulomatosis, glomerulonephritis, anti-phospholipid syndrome,

and autoimmune polyarthritides), a neoplastic disorder (e.g. leukemia,

sarcomas, myelomas, carcinomas, neuromas, melanoma, cancers of the

Claim 8; Column 5; 18pp; English.

```
breast, brain, colon, cervix, and prostate, Hodgkin's disease and non-Hodgkin's lymphoma), inflammatory disorders (e.g. inflammatory joint disorders and inflammatory induced cell damage to the eye, brain and other organs), ischemia or reperfusion injury (e.g. myocardial ischemia and reperfusion injury, renal ischemia, spinal cord ischemia and/or insult (e.g. liver toxicity, pulmonary toxicity, toxic damage to other organs from chemicals, radiation, and other noxicus substances), macular degeneration, cataract formation, and other noxicus substances), macular ulcerative collisis, accelerated aging, spinal cord disease (e.g. motor neuron diseases, degeneration of the spinal cord disease (e.g. motor and demyelinating disease), bypass surgery, chemotherapy,

New peptides obtained from streptokinase, useful in ameliorating cell death due to apoptosis and/or necrosis and treating neurodegenerative, neoplastic, immune, cardiovascular and inflammatory disorders

```
The invention relates to an isolated peptide obtained from streptokinase, or its derivative or analog, which ameliorate cell death. The activity of peptides of the invention may be described as, nootropic, neuroprotective, antiparkinsonian, anticonvulsant, cytostatic, antiparkinsonian, anticonvulsant, cytostatic, antibacteries anticonvulsant, cardiant, cantidiabetic, antianaemic, virucide, ophthalmological, dermatological, antidiabetic, antianaemic, virucide, ophthalmological, comprising peptides of the invention are useful for treating comprising peptides of the invention are useful for treating neurodegenerative diseases (e.g. Parkinson's, Alzheimer's, Huntington's disease and cerebellar degeneration) neoplastic disorders including conneur diseases (e.g. heart failure, atherosclerosis and myocardial reperfusion injury), immune diseases (e.g. autoimmune diseases, acquired immunodeficiency syndrome (AIDS), rheumatorid arthritis, systemic lupus erythematosus, diabetes mellitus, pernicious anaemia), myelodegenerative diseases, viral diseases, and degenerative diseases, of converse including bacteria, parasite, prion-based diseases, and deseases, understative colitis, cataracts, pancerative diseases, accelerated aging. The current sequence represents a streptokinase colling anaemiah, in rawiar myelome with an ability to amellorate cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       death in cardiac myocytes

The specification describes a polypeptide which binds to a streptokinase-specific antibody and prevents the antibody binding to native streptokinase. The specification also describes a synthetic polypeptide (PI) comprising an epitope which binds to an streptokinase-specific antibody and reduces thrombolytic activity of streptokinase. Pl is used in thrombolytic therapy, and to prevent or treat glomerulonephritis and rheumatic fever.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to an isolated peptide obtained from streptokinase, or its derivative or analog, which ameliorate cell death. The activity of cor its derivative or analog, which ameliorate cell death. The activity of peptides of the invention may be described as, noctropic, neuroprotective, antiparkinsonian, anticonvulsant, cytostatic, antiatherosalerotic, vasokropic, immunosuppressive, anti-HTV.

C antinflammatory, antidiabetic, antianeamic, virucide, ophthalmological, dermatological, antidiabetic, antianeamic, virucide, ophthalmological, antiulcates apoptosis and necrosis in a warm-blooded animal. Compositions comprising peptides of the invention are useful for treating neurodegenerative diseases (e.g. Parkinson's, Alzheimer's, Huntington's comprising peptides of the invention are useful for treating cancer, inflammatory disorders (e.g. Parkinson's, Alzheimer's, Huntington's disorders in carcinson injury), immune diseases (e.g. authritis, inflammatory joint disease, acquired immunodeficiency syndrome (AIDS), rheumatoid arthritis, systemic lupus erythematosus, diabetes mellitus, permicious anaemia), systemic lupus erythematosus, diabetes mellitus, permicious anaemia), wysloegenerative diseases, ustanaemia, any organ. Other disorders include macular degeneration, cataracts, and essess and cromanaemia), any organ. Other disorders include macular degeneration, cataracts, and testive solicis, parasite, prion-based diseases, and

induces fibrin-dependent plasmingen activation in a pharmaceutical composition for dissolving blood clots. Also described are: (1) a composition comprising an isolated modified streptokinase, the modification being removal of anno acid residues in the amino terminus; (2) a method for dissolving a blood clot in a subject, comprising administering to the subject a fibrin-dependent streptokinase protein; a mucleic acid (1) encoding a modified bacterial streptokinase protein; the expression vector comprising (1) and (4) a host cell transformed with the expression vector comprising (1), and (4) a host cell transformed with the expression vector of (3). The pharmaceutical composition comprising a become plasmingen activator is useful for dissolving blood clots in patients with a thrombotic condition, e.g. myocardial infarction, venous thrombosis, pulmonary embolism, cerebral thrombosis, graft thrombosis and arterial thrombosis. The modified streptokinase can also be used in non-human mammals. Streptokinase activation of plasminogen is at least 10-fold, preferably 100-fold greater in the presence of fibrin than in the absence of fibrin. The modified streptokinase has at least one amino acid substitution that inactivates a substrate site for proceolytic cleavage. This reduces the rate of degradation of the streptokinase at least two-fold, The present represents recombinant streptokinase, designated rSK144-293.
                                                                                                                                                                                                                                                                                                                                                                                                   The present invention describes an isolated bacterial protein that

The specification describes a polypeptide which binds to a streptokinase-specific antibody and prevents the antibody binding to native streptokinase. The specification also describes a synthetic polypeptide (PI) comprising an epitope which activity of streptokinase-specific antibody and reduces thrombolytic activity of streptokinase. It is used in thrombolytic therapy, and to prevent or treat glomerulonephritis and rheumatic fever.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Streptococcus, streptokinase, fibrin-dependent plasminogen activator, nSK; rSK; bacterial; blood clot, thrombotic condition, myocardial infarction; venous thrombosis; pulmonary embolism; cerebral thrombosis; graft thrombosis; arterial thrombosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                      ptide, streptokinase, streptokinase-specific antibody, activity, thrombolytic therapy, glomerulonephritis,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                             Peptide corresponding to amino acids 148-293 of streptokinase.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New polypeptides which bind streptokinase-specific antibodies useful in thrombolytic therapy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                100.0%; Score 30; DB 20; Length 146; 100.0%; Pred. Streptokinase derivative having a C-terminal deletion (i.e. Pro 373-Lys 414) and Arg 45 to Gly 68 also being deleted. Derivatives show a decreased antigenicity, higher stability in blood and greater selectivity of thrombolytic activity and specificity.

The protein is used as a thrombolytic agent in patients with lung thrombus or myocardial infarction.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                              The present sequence represents a peptide corresponding to amino acids 120-352 of streptokinase. The specification describes a polypeptide which binds to a streptokinase-specific antibody and prevents the antibody binding to native streptokinase. The specification also describes a synthetic polypeptide (P1) comprising an epitope which binds to an streptokinase-specific antibody and reduces thrombolytic activity of streptokinase. In is used in thrombolytic therapy, and to prevent or treat glomerulonephritis and rheumatic fever.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present sequence is that of streptokinase encoded by a pST-1 HindIII fragment. Recombinant streptokinase can be produced by culturing bacteria transformed with a high efficiency plasmid contg. the streptokinase gene, amplified by using haemolytic Streptococcus as the template and using inducers based on the streptokinase nucleotide sequence. The recombinant streptokinase is used to treat thrombotic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

```
The sequence was deduced from DNA obtd. from PCR amplified chromosomal DNA from S. equisimilis (Lancefield's Gp C) ATCC 10009 or ATCC 9642.

ATCC 9642.

Minal and engineered to add a Met codon prior to codon 16 of the streptokinase CDS. The construct was used to prepare expression vector pGG06 for prodh. of the streptokinase core molecule.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         induces fibrin-dependent plasmingen activation in a pharmaceutical composition comprising an isolated modified streptokinase, the modification being removal of amino acid residues in the amino terminus; (2) a method for dissolving a blood clot in a subject, comprising a modified treptokinase in the amino terminus; (2) a method for dissolving a blood clot in a subject, comprising a multiple carification to the subject a fibrin-dependent streptokinase protein; a nucleic acid (1) encoding a modified bacterial streptokinase protein; the expression vector comprising (1); and (4) a host cell transformed with the expression vector comprising (1); and (4) a host cell transformed with the expression vector of (3). The pharmaceutical composition comprising a bacterial fibrin-dependent plasminogen activator is useful for a bacterial fibrin-dependent plasminogen activator is useful for myocardial infarction, venous thrombosis. pulmonary embolism, cerebral thrombosis, graft thrombosis and arterial thrombosis. The modified streptokinase can also be used in non-human mammals. Streptokinase activation of plasminogen is at least 10-fold, preferably 100-fold greater in the presence of fibrin than in the absence of fibrin. The modified streptokinase has at least on amino acid substitution that inactivates a substrate site for proteolytic cleavage. This reduces the rate of degradation of the streptokinase at least two-fold. The present sequence represents recombinant streptokinase designated rSK59-414.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö

                                                                                                                                                                Streptokinase derivative having a C-terminal deletion (i.e. Pro 373-Ly8 414) and Phe at position 118 being deleted. Alternatively, Phe 118 can be replaced with any other amino acid. Derivatives show a decreased antigenicity, higher stability in blood and greater selectivity of thrombolytic activity and specificity. The protein is used as a thrombolytic agent in patients with lung thrombus or myocardial infarction. See also AAQ10230 and AAR10196-R10200.

                                                                                                                                                           Streptokinase derivative having a C-terminal deletion (i.e. Pro 373-Lyg 414) and retaining streptokinase activity. One or more of the amino acids can be replaced by a different amino acid at the same position or it can be deleted Alternatively, an extra residue can be inserted into the sequence. Derivatives show a decreased antigenicity, higher stability in blood and greater selectivity of thrombolytic activity and specificity. The protein is used as a thrombolytic agent in platients with lung thrombus or myocardial infarction. See also AAQ10230 and AAR10195-R10199.
Synthetic gene encoding streptokinase - scale, high purity prodn. of streptokinase used as a thrombolytic agent
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ·

                                                                                                                                                                                                                                                                                                                                                                    Recombinant production of streptokinase mutants, useful as thrombolytic agents for treating myocardial infarction, that are truncated at the Nor C-terminus
                                                                                                                                                                                                                                                                                                                                                                                                                                 The present sequence represents a mutant protein of the streptokinase SKC-2. Streptokinase forms a complex with plasminogen, activating its conversation to plasmin. The SKC-2 gene was modified to produce the mutant protein. The obtained mutants conserve their capacity for plasminogen activator complex formation, thus having reduced antigenicity. The mutants are derived from the 1-1119 gene fragment, and retain the thrombolytic activity of SKC-2 but, compared with the full-length protein, are less antigenic and retain activity better in presence of antibodies that neutralize activity of the complete protein. The mutants are thrombolytic agents which are useful for treating myocardial infarction, pulmonary thromboembolism, surgical complications and other forms of thrombosis.

Derivatives show a decreased antigenicity, higher stability in blood and greater selectivity of thrombolytic activity and specificity. The protein is used as a thrombolytic agent in patients with lung thrombus or myocardial infarction. See also AAQ10230, AAR10195-7 and AAR10199-R10200.

Recombinant production of streptokinase mutants, useful as thrombolytic agents for treating myocardial infarction, that are truncated at the Nor C-terminus -
                                                                                                                                                                  The present sequence represents a mutant protein of the streptokinase SKC-2. Streptokinase forms a complex with plasminogen, activating its conversion to plasmin. The SKC-2 gene was modified to produce the mutant protein. The obtained mutants conserve their capacity for plasminogen activator complex formation, thus having reduced antigonicity. The mutants are derived from the 1-1119 gene fragment, and retain the thrombolytic activity of SKC-2 but, compared with the full-length protein, are less antigenic and retain activity better in presence of antibodies that neutralize activity of the complete protein. The mutants are thrombolytic agents which are useful for treating myocardial infarction, pulmonary thromboembolism, surgical complications and other forms of thrombosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Streptokinase derivative having a C-terminal deletion (i.e. Pro 373-Lys 414) and Arg 45 to Gly 68 also being deleted. In addition Gln residues replace Lys at positions 256 and 257. This is an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Synthetic gene encoding streptokinase - scale, high purity prodn. of streptokinase used as a thrombolytic agent

Recombinant production of streptokinase mutants, useful as thrombolytic agents for treating myocardial infarction, that are truncated at the N-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present sequence represents a mutant protein of the streptokinase SKC-2. Streptokinase forms a complex with plasminogen, activating its conversion to plasmin. The SKC-2 gene was modified to produce the mutant protein. The obtained mutants conserve their capacity for plasminogen activator complex formation, thus having reduced antigencity. The mutants are derived from the 1-119 gene fragment, and retain the thrombolytic activity of SKC-2 but, compared with the full-length protein, are less antigenic and retain activity better in presence of antibodies that neutralize activity of the complete protein. The mutants are thrombolytic agents which are useful for treating myocardial infarction, pulmonary thromboembolism, surgical
example of a streptokinase derivative which is a combination of two individually claimed modifications. Derivatives show a decreased antigenicity, higher stability in blood and greater selectivity of thrombolytic activity and specificity. The protein is used as a thrombolytic agent in patients with lung thrombus or myocardial infarction. See also AAQ10230, AAR10195-8 and AAR10200.

the present sequence represents a mutant protein of the streptokinase

The invention relates to an isolated peptide obtained from streptokinase, or its derivative or analog, which ameliorate cell death. The activity of peptides of the invention may be described as, nootropic, neuroprotective, antiparkinsonian, anticonvulant, cytostatic, antiparkinsonian, anticonvulant, cytostatic, antiantherosalerotic, vasotropic, immunosuppressive, anti-HTV.

CC antialherosalerotic, vasotropic, immunosuppressive, anti-HTV.

CC dermatological, antidiabetic, antiparasitic. Peptides of the invention are useful for treating comprising peptides of the invention are useful for treating comprising peptides of the invention are useful for treating neurodegenerative diseases (e.g. Parkinson's, Alzheimer's, Huntington's comprising peptides of the invention are useful for treating neurodegenerative diseases (e.g. harthritis) inflammatory disorders including cancer, inflammatory disorders (e.g. arthritis) inflammatory joint diseases and cerebellar diseases (e.g. heart failure, atherosalerosis and myocardial reperfusion injury), immune diseases (e.g. autoimmune diseases, acquired immunodeficiency syndrome (ALDS), rheumatorial arthritis, systemic lupus erythematosus, diabetes mellitus, pernicious anaemia), myelodegenerative diseases, viral diseases, and degenerative diseases, viral diseases, and degenerative diseases, undertaive colitis, cataractes, panceraitis, infectious diseases including bacteria, parasite, prion-based diseases, and errentative degenerative systemic serythematosus, darbet expensents a representative

SKC-2. Streptokinase forms a complex with plasminogen, activating its conversion to plasmin. The SKC-2 gene was modified to produce the mutant protein. The obtained mutants conserve their capacity for plasminogen activator complex formation, thus having reduced antigenicity. The mutants are derived from the 1-119 gene fragment, and retain the thrombolytic activity of SKC-2 but, compared with the full length protein, are less antigenic and retain activity better in presence of antibodies that neutralize activity of the complete protein. The mutants are thrombolytic agents which are useful for treating myocardial infraction, pulmonary thromboembolism, surgical complications and other forms of thrombosis.
                                                                                                                                                                                                                                                                                                Gaps

The present sequence represents the amino acid sequence of a representative streptokinase from which the cell death ameliorating peptides are produced.

                                                                                                                                                                                                                                                                                                                                            The SKC-2 gene was isolated from S.equisimilis type C by gene amplification from the synthetic primers SK1, SK2 and SK3 (see AAQ20666-8). The SKC-2 gene was inserted into yeast expression vector pPS-7 for extracellular expression of streptokinase and into pNAO for intracellular expression in yeast. For expression in bacteria, the SKC-2 gene was inserted in plasmid pEKG3, between a trp promoter

The present invention describes an isolated bacterial protein that induces fibrin-dependent plasminogen activation in a pharmaceutical composition for dissolving blood clots. Also described are: (1) a composition comprising an isolated modified streptokinase, the modification being removal of amino acid residues in the amino terminus; (2) a method for dissolving a blood clot in a subject, comprising can mucleic acid (1) encoding a modified bacterial streptokinase; (3) an a mucleic acid (1) encoding a modified bacterial streptokinase; (3) an a mucleic acid (1) encoding a modified bacterial streptokinase; (3) and expression vector comprising (1); and (4) a host cell transformed with the expression vector of (3). The pharmaceutical composition comprising (2) and (3) and (4) a host cell transformed with the expression vector of (3). The pharmaceutical condition, e.g. myocardial infarction, venous thrombosis, pulmonary embolism, cerebral thrombosis, graft thrombosis and arterial thrombosis. The modified streptokinase can also be used in non-human mammals. Streptokinase con also be used in non-human mammals. Streptokinase con also be used in non-human mammals. Streptokinase has at least to lefold, preferably 100-fold cancelided streptokinase has at least to ne amino acid substitution that in a mativaled streptokinase at least to sequence represents native streptokinase at least to sequence represents
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö

The present sequence represents native SK. SK is a secretory protein of haemolytic Streptococcus able to activate human plasminogen (HPlg) to plasmin (HPlm), which is a serine protease able to catalyse the hydrolysis of fibrin in blood clots. The SK is useful as a thrombolytic agent in the treatment of vascular thromboembolytic symptoms such as acute myocardial infarction. Compared with wild-type SK, the KSPE mutant is more resistant to degradation by human plasmin and is more effective both in acting as a fibrolytic agent and in activating human plasminogen.

The present sequence is mutant SK K59E. SK is a secretory protein of haemolytic Streptococcus able to activate human plasminogen (HPlg) to plasmin (HPlm), which is a serine protease able to catalyse the hydrolysis of fibrin in blood clots. The SK is useful as a thrombolytic agent in the treatment of vascular thrombombolytic symptoms such as acute myocardial infarction. Compared with wild-type SK, the K59E mutant is more resistant to degradation by human plasmin and is more effective both in acting as a fibrolytic agent and in activating human plasminogen.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

The invention relates to a method for the production of non-immunogenic proteins. The method comprises determining at least part of the amino acid sequence of the protein, (b) identifying in the amino acid sequence one or more potential epitopes for T-cells (T-cell epitopes) of the given species, and (c) modifying the amino acid sequence to eliminate at least one of the T-cell epitopes identified in step (b) thereby to eliminate or reduce the immunogenicity of the protein when exposed to the immune or system of the given species. A method of analysing a pre-existing protein to predict the basis for immunogenic responses is also provided. The methods can be used particularly for reducing the immunogenicity of immunoglobulins or therapeutic proteins e.g. Streptokinase (SK). The products can be used for diagnosis and therapy. The present sequence represents the amino acid sequence of the SK protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

The invention relates to a method for the production of non-immunogenic proteins. The method comprises determining at least part of the amino acid sequence of the protein, (b) identifying in the amino acid sequence one or more potential epitopes for T-cells (T-cells epitopes) of the given species, and (c) modifying the amino acid sequence to eliminate at least one of the T-cell epitopes identified in step (b) thereby to eliminate or reduce the immunogenicity of the protein when exposed to the immune system of the given species. A method of analysing a pre-existing protein to predict the basis for immunogenic responses is also provided. The methods can be used particularly for reducing the immunogenicity of immunoglobulins or therapeutic proteins, e.g. Streptokinase (SK). The products can be used for diagnosis and therapy. The present sequence represents the amino acid sequence of a de-immunised SK protein molecule.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Streptokinase; SK; hybrid plasminogen activator; fibrin binding region; plasminogen; human; fibronectin; thrombolytic therapy; cardiovascular disorder; fibronectin.

This sequence represents the human Streptococcus equisimilus streptokinase protein sequence. The invention relates to a hybrid plasminogen activator (PA) comprises a polypeptide fusion between plasminogen activator (PA) comprises a polypeptide fusion between contexpokinase (SK), which are capable of plasminogen (PG) activation, and fibrin binding regions of human fibronectin, which are from fibrin binding domains (PBD) 4 and 5 or 1 and 2. The hybrid PA possesses the binding domains (PBD) 4 and 5 or 1 and 2. The hybrid PA possesses the billity to bind with fibrin independently and also characteristically retains a PG activation ability which becomes evident only after a pronounced duration, or lag, after exposure of the PA to a suitable animal or human PG. The hybrid streptokinase-fibrin binding domain polypeptides are useful in thrombolytic therapy for various kinds of cardiovascular disorders. The hybrids have enhanced fibrin selectivity as cardiovascular disorders. The hybrids have enhanced fibrin selectivity of natural streptokinase in being characterised by a temporary delay, or lag of several minutes in the natural rate of the catalytic conversion of plasmin (i.e. delayed-action thrombolysis). The proteins can bind tightly with fibrin in blood clots soon after introduction into the vascular system without significantly activating the circulation of the plasminogen activation process to the site of pathological thrombus. This overcomes systemic plasminogen activation centuation clinical use of streptokinase.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  aB

rectains or their fragments can be rendered non-immunogenic or less immunogenic by identifying one or more potential T cell epitopes and modifying the sequence to eliminate at least one of these T cell epitopes to reduce the immunogenicity of the protein when exposed to epitopes to reduce the immunogenicity of the protein when exposed to the immune system of another organism. The method can be used for producing a protein with an enzymatic activity which has a beneficial therapeutic effect, a protein used to convert inactive drugs to its active form within a living organism; a vaccine, a protein used as a carrier of other molecules or a protein which binds to other molecules within or introduced within the living organism; in order to alter the collection of other molecules, such that the protein does not stimulate immune response in the living organism. The less immunogenic protein is useful in medicine, diagnosis and in manufacture of a certain strains of beta-haemolytic streptoxinase is produced by certain strains of beta-haemolytic streptoxinase is produced by contract or interapeutic or a diagnostic agent. Streptoxinase is an affective thrombolytic agent in the treatment of coronary thrombosis, or improving survival and preserving left ventricular function following mycoardial infarction. The native protein is immunogenic and the protein to a single use. The new method could provide a longer corpuspentic use for streptoxinase. This is the sequence of the altered streptoxinase. The wild type streptoxinase sequence is given in AAB01295. See GENESEQ records AAB01289-B01302.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Rendering a protein non-immunogenic or less immunogenic useful in medicine and in diagnostics involves determining the amino acid sequence of the protein, identifying and modifying potential epitopes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 100.0%; Score 30; DB 21; Length 414; 100.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              XXXXXX
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Exproteins or their fragments can be rendered non-immunogenic or less immunogenic by identifying one or more potential T cell epitopes and modifying the sequence to eliminate at least one of these T cell cepitopes to reduce the immunogenicity of the protein when exposed to the immune system of another organism. The method can be used for the producing a protein with an enzymatic activity which has a beneficial ceffect, a protein used to convert inactive drugs to its active form within a living organism, a vaccine, a protein used as a carrier of other molecule or a protein which binds to other molecules within or introduced within the living organism. The less immunogenic bio distribution of other molecules, such that the protein does not stimulate immune response in the living organism. The less immunogenic protein is useful in medicine, diagnosis and in manufacture of a certain strains of beta-haemolytic streptokinase is produced by certain strains of beta-haemolytic streptokinase is produced by certain strains of beta-haemolytic streptokinase is produced by promitiating its activation to plasmin and thereby promoting the continity in survival and preserving left ventricular function following organization of fibrin filaments in blood clots. Streptokinase is an effective thrombolytic agent in the treatment of coronary thrombosis, improving survival and preserving left ventricular function following convential infarction. The new method could provide a longer production of neutralising antibodies in humans generally limits the protein to a single use. The new method could provide a longer therapeutic use for streptokinase. This is the sequence of the wild type streptokinase. The altered streptokinase sequence is given in AAB01296. See GENESEQ records AB01289-801302.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                        Rendering a protein non-immunogenic or less immunogenic useful in medicine and in diagnostics involves determining the amino acid sequence of the protein, identifying and modifying potential epitopes

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention describes a method to create mutants of streptokinase (SK) which become more resistant to hydrolytic inactivation by human plasmin (HPIM) and more effective in activation of chuman plasmin (HPIM) and more effective in activation of the more inactivation by human plasmin (HPIM) and more sequence of the care of a commercially available. The novel HPIM hydrolysis resistant SK can be created by the techniques of gene engineering to substitute the amino acid residues near the peptide bonds that are hydrolysed by HPIM. The mutant SK can be used to form HPIQ and native SK and could be used as a thrombolytic agent. The mutant SK sequence could be coupled with other proteins to form fusion proteins and improve the fibrinolytic activity of the fusion proteins. Some truncated SKs such as SK(16.718) could activate thing as efficiently as native SK. The truncated SKs comprising the tusion proteins activity than the corresponding native truncated SK. Since Lya59-Ser60 is among the few peptide bonds which are claaved in the early reaction with HPIM and the NH2-terminal peptide chain of the hydrolysis of the peptide bond of Lya59-Ser60 should be able to prevent the hydrolysis of the peptide bond and might improve the stability of SK as a HPIQ activator. The present sequence represents the mutant of SK as a HPIQ activator. The present sequence represents the mutant of SK as a HPIQ activator. The present sequence represents the mutant of SK as a HPIQ activator. The present sequence represents the mutant of SK as a HPIQ activator or the present invention.

N.B. The present sequence corresponds to the indexers best interpretation of the sequence given in the specification, which is of poor quality

The present sequence is streptokinase, a single-peptide secretory protein which is produced by various strains of haemolytic Streptococcus. Streptokinase forms a tight binding complex with human plasminogen, causing the spontaneous conversion of plasminogen to its active form, plasmin the spontaneous conversion of plasminogen to its active form, plasmin the spontaneous conversion of plasmin ogen to its active form, plasmin the stracellular fluids of vertebrates. Plasmin is implicated in the extracellular proteolysis associated with a wide range of physiological processes. Plasminogen activators regulate plasminogen expression either by forming a binding complex, as in the case of streptokinase, or by hydrolysing a peptide bond in plasminogen activators and chymotrypsin has identified a six amino acid peptide involved in plasminogen activation. This peptide is particularly useful human plasminogen acid realdues 64s and 645 of full length human plasminogen acid realdues 64s and 645 of full length human plasminogen.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             human plasminogen. Novel plasminogen activators have been made based upon
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          the plasminogen activation/recognition site of plasminogen binding
proteins. The polypeptides are useful in preparing thrombolytic agents
for treating blood clotting disorders such as heart attack.

Streptokinase produced using E.coli transformed with a recombinant streptokinase vector can be isolated for use as a thrombolytic agent to facilitate the in vivo lysis or dissolution of blood clots. The vector is esp. a plasmid obtd. from E.coli, esp. plasmid pBR 322. Recombinant plasmid pMF1 as defined by a restriction endonuclease map is claimed. Escherichia coli HB 101 harbouring plasmid pMF1 is depositd as ATCC 39613.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Streptokinase A; recombinant phage; thrombolytic agent; plasminogen; plasmin.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This invention describes a novel thrombolytic agent comprising streptokinase where at least one nonessential portion has been modified. The invention also describes a method of forming a thrombolytic agent comprising determining a nonessential portion of streptokinase and modifying the nonessential portion to render the resulting protein less antigenic. The modified streptokinase is used to treat blood clot disorders, such as heart attacks. The modified streptokinase has less antigenicity than streptokinase but is still able to complex plasminogen and lead to plasminogen activation. Modified streptokinase with the nonessential portions removed or trundated simplify the molecule. Such smaller proteins are cheaper and easier to produce. This sequence represents a fragment of a Streptococcus sp. streptokinase protein which is used in the description of the method of the invention.

Infected cells are cultured in lig. medium contg. assimilable C and N sources, and streptokinase G is isolated from the cell lysate.

The infected cells provide the protein in high yields, i.e. 600 U/ml which is 1.5-2 times that for the donor strain.

The protein activates the autocatalytic conversion of human plasmin, so is potentially useful as a thrombolytic agent. See also DD-276694 (AAQOS604).

(Updated on 25-MAR-2003 to correct PA field.)
              Lambda 147.1 is ligated with genomic DNA from S. pyogenes SF130/13 and the resultant product used to transform bacteria. Infected cells are cultured in liq. medium contg. assimilable C and N sources, and streptokinase A is isolated from the cell lysate. The infected cells provide the protein in high yields, i.e. 1000 U/ml compared to 80 U/m; for the donor strain. The protein activates the autocatalytic conversion of human plasmin, so is potentially useful as a thronbolytic agent. See also DD-276693 (AAQ05603).

The sequence was deduced from PCR amplified chromosomal DNA from S. equisimilis (Lancefield's Gp C ) ATCC 10009 or ATCC 9642. The primers used for the PCR were based on the published DNA sequence of S. equisimilis strain H66A (Malke, H., Roe, B., and Perretti, J.J., Gene 34 357-362 [1985]). See Swiss-Prot K02986 and P00779 and Geneseq N70106. The gene can be used to construct expression eccord in which the streptokinase gene is linked to a second gene encoding e.g. another streptokinase protein, hirudin, or a streptokinase-like protein, via a linking sequence encoding a cleavage site for e.g. factor Xa or thrombin. The enzymes which cleave the fusion protein are present at the site of the target thrombus so the active agents are released specifically at the place where clot
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Pusion protein cleavage by blood clotting enzyme - for prodn. of fractions having greater antithrombotic activity for therapy and

                                                                          음
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to a protein (ABP25413-ABP30895) from group B streptococcus/GBS (Streptococcus agalactiae) or group A streptococcus/GBS (Streptococcus pyogenes), comprising one of 5483 sequences (S1), given in the specification. The proteins have antibacterial and antiinflammatory activity. [1], mucleic acids encoding (1), ABN66044-ABN71526 and antibodies that bind (1) are used in the manufacture of medicaments for the treatment or prevention of infection or disease caused by Streptococcus bacteria, particularly S. agalactica and S. pyrogenes. Nucleic acids encoding (1) are used to determine whether a compound binds to (1). A composition comprising (1) or a nucleic acid encoding (1), may be cused as a vaccine or diagnostic composition. The disease caused by Streptococcus that is prevented or treated may be meningitis. Nucleic acid encoding (1) may be used to recombinantly produce (1) and may be used in gene therapy. Antibodies to (1) are used for affinity chromatography, immunoassays, and distinguishing/identifying

The protein is a recombinant product of a gene fusion construct.

The sequence of the synthetic hirudin HV-1 genes was designed

The sequence of the synthetic hirudin HV-1 genes was designed

Enters 165 180 (1984).

Letters 165 180 (1984).

The sequence (both as sequence of streptokinase was obtd.

From PCR samplified chromosomal DNA from S. equisimilis ATCC 10009

C or ATCC 9642.

The primers used for the PCR were based on the published DNA sequence of S. equisimilis strain H46A (Malke, H. Roe, I ished DNA sequence of S. equisimilis strain H46A (Malke, H. Roe, I ished DNA sequence of S. equisimilis strain H46A (Malke, H. Roe, I ished DNA sequence were used to construct an expression vector in which the hirdin gene is linked to the streptokinase gene via a linking sequence encoding a cleavage site for factor Xa. The factor Xa is present at the site of the target thrombus so the active agents are released specifically at the place where clot formation is occurring.

The sequence of the synthetic hirudin HV-1 genes was designed
assed on the published amino acid sequence (bodd J., et al FBBS)

Letters 165 180 (1984). The sequence of streptchinase was obtd.

Cor APCC 9642. The primers used for the PCR were based on the published bunks are used for the PCR were based on the published bunks are used to construct an expression vector in which the sequence encoding a cleavage site for factor Xa. The factor Xa is sequence encoding a cleavage site for factor Xa.

Cor APCC 10009

Cor APCC 9642. The primers used for the bunks of the two is sequence used to construct an expression vector in which the streptchinase gene is linked to the hirudin gene via a linking sequence encoding a cleavage site for factor Xa. The factor Xa is present at the site of the target thrombus so the active agents are creased specifically at the place where clot formation is occurring. See also AAR12889.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The streptokinase sequence was obtd. from PCR amplified chromosomal DNA from S. equisimilis (Lancefield's Gp C) ATCC 10009 or ATCC 9642 (the primers used for the PCR were based on the published DNA sequence, G. equisimilis strain H46A (Malke, H., Roe, B., and Perretti, J.J., Gene 34 357-362 [1985]). The gene was fused to DNA encoding the yeast alpha factor pre-pro-secretion sequence in an expression vector, pSMD1/152, for prodn. of recombinant streptokinase in S. cerevisiae strain BJ2168. The present invention describes an isolated bacterial protein that induces fibrin-dependent plasminogen activation in a pharmaceutical composition comprising an isolated modified streptokinase, the composition comprising an isolated modified streptokinase, the composition comprising an isolated modified streptokinase, the modification being removal of animo acid residues in the amino terminus; (2) a method for dissolving a blood clot in a subject, comprising a duninistering to the subject a fibrin-dependent streptokinase; (3) an expression vector comprising (1); and (4) a host cell transformed with the expression vector comprising (1); and (4) a host cell transformed with the expression vector of (3). The pharmaceutical composition comprising a bacterial fibrin-dependent plasminogen activator is useful for dissolving blood clots in patients with a thrombotic condition, e.g. myocardial infarction, venous thrombosis, pulmonary embolism, cerebral thrombosis graft thrombosis and atterial thrombosis. Streptokinase can also be used in non-human mammals. Streptokinase can also be used in non-human mammals. Streptokinase completed streptokinase has at least to fold, preferably 100-fold greater in the presence of fibrin than in the absence of fibrin than in the discreptivition that inactivates a substrate site for proteclytic cleavage. This reduces the inactivates a substrate site for proteclytic cleavage. This reduces the sequence represents recombinant streptokinase at least two-fold The present sequence represents recombinant streptokinase, designated risked 414.
myocardial infarction, venous thrombosis, pulmonary embolism, cerebral thrombosis, graft thrombosis, arterial thrombosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Length 736;

induces fibrin-dependent plasminogen activation in a pharmaceutical composition comprising an isolated modified streptokinase, the composition comprising an isolated modified streptokinase, the modification being removal of anion acid residues in the amino terminus.

(2) a method for dissolving a blood clot in a subject, comprising administering to the subject a fibrin-dependent streptokinase protein; anuclaic acid (1) encoding a modified bacterial streptokinase protein; capression vector comprising (1); and (4) a host cell transformed with expression vector comprising (1); and (4) a host cell transformed with a bacterial fibrin-dependent plasminogen activator is useful for dissolving blood clots in patients with a thrombotic condition, e.g. myocardial infarction, venous thrombosis, pulmonary embolism, creebral thrombosis, graft thrombosis and arterial thrombosis. The modified streptokinase can also be used in non-human mammals. Streptokinase can also be used in non-human mammals. Streptokinase activation of plasminogen is at least to effect protectolytic cleavage. The modified creeptokinase has at least one amino acid substitution that inactivates a substrate site for proteolytic cleavage. The present creptesents a streptokinase at least two-fold. The present sequence represents a streptokinase at least two-fold. The present sequence represents a streptokinase at least two-fold. The present sequence represents a streptokinase and maltose binding protein fusion protein from an example of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention describes an isolated bacterial protein that
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The sequence was deduced from DNA obtd. from PCR amplified chromosomal DNA from S. equisimilis (Lancefield's Gp C) ATCC 10009 or ATCC 9642. The gene was tuncated by 15 codons at the 3' terminal and one copy engineered to add a Met codon prior to codon 16 of the CDS. The two truncated genes were used to construct an expression vector in which they were linked via a sequence encoding a cleavage site for thrombin which, when cleaved, releases the individual proteins which have antithrombotic activity. The thrombin is present at the site of the target thrombus so the active agents are released specifically at the place where clot formation is occurring. of streptokinase. This fragment was used in the design of a modified streptokinase has an in vitro degradation rate at le 2 times slower than that of native streptokinase. Compounds containing modified streptokinases are specifically used as thrombolytic agents for dissolving blood clots in vivo in a mammal, preferably at a dose of 20000 U/kg, opt. as a bolus rather than by continuous infusion.

                                                                                                                                                           Modified forms of streptokinase resistant to enzymatic cleavage -
useful as thrombolytic agents in treating thrombosis and in medical
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Modified forms of streptokinase resistant to enzymatic cleavage - useful as thrombolytic agents in treating thrombosis and in medical equipment
                                                                                                                                                                                                                                           This sequence represents the plasminogen-binding fragment of streptokinase which lacks the N-terminal 14 amino acids. This modified streptokinase has an in vitro degradation rate at least 2 times slower than that of native streptokinase. Compounds containing modified streptokinases are specifically used as thrombolytic agents for dissolving blood clots in vivo in a mammal, preferably at a dose of 20000 U/kg, opt. as a bolus
                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Plasminogen-binding fragment; streptokinase; degradation; MBP; thrombolytic agent; blood clot; bolus; maltose-binding protein.

This fusion protein was used in the design of a modified streptokinase has an in vitro degradation rate at least 2 times slower than that of native streptokinase. Compounds containing modified streptokinases are specifically used as thrombolytic agents for dissolving blood clots in vivo in a mammal, preferably at a dose of 20000 U/kg, optionally as a bolus rather than by continuous infusion.
                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Modified forms of streptokinase resistant to enzymatic cleavage -
useful as thrombolytic agents in treating thrombosis and in medical
genes are linked via a sequence encoding a cleavage site for thrombin which, when cleaved, releases the individual proteins which have anti-thrombotic activity. The thrombin is present at the site of the target thrombus so the active agents are released specifically at the place where clot formation is occurring. This modified streptokinase has an in vitro degradation rate at least 2 times slower than that of native streptokinase. Compounds containing modified streptokinases are specifically used as thrombolytic agents for dissolving blood close in vivo in a mammal, preferably at a dose of 20000 U/kg, optionally as a bolus rather than by continuous infusion.

This fusion protein was used in the design of modified streptokinase has an in vitro degradation rate at least 2 times slower than that of native streptokinase. Compounds containing modified streptokinases are specifically used as thrombolytic agents for dissolving blood colots in vivo in a mammal, preferably at a dose of 20000 U/kg, optionally as a bolus rather than by continuous infusion.

                                                    This sequence represents a fusion protein between maltose-binding protein and a modified form of the plasminogen-binding fragment of streptokinase containing 6 point mutations. This modified streptokinase has an in vitro degradation rate at least 2 times slower than that of native streptokinase. Compounds containing modified streptokinases are specifically used as thrombolytic agence for dissolving blood closs in vivo in a mammal, preferably at a dose of 20000 U/kg, optionally as a bolus rather than by continuous infusion.

Peptides that ameliorate cell death useful for treating conditions associated with cellular differentiation Claim 2; Column 12; 15pp; English.

AAY25009-Y25019 are novel peptides derived from streptokinase that

C ameliorate cell death. The products of the invention and their encoding

C nucleic acids may be useful for treating diseases and conditions related

to aging, cellular differentiation, physical insult (e.g. physical

CC trauma, anoxia, hyperthermia, hypothermia, chemically induced damage,

and trauma to the brain, spinal cord, kidney, heart, lungs, liver, skin

and any other organ), viral disorders (e.g. hepatitis, retroviral

infections, viral encephalitis, and ADDS/HIV), neurodegenerative

CC disorders (e.g. parkinson's disease, Alzheimer's disease, Huntington's

disorders (e.g. parkinson's disease, Alzheimer's disease, Huntington's

CC disease, cerebellar degenerations, and familial amyotrophic lateral

sclerosis (FALS), cardiovascular disease (e.g. atherosclerosis,

CC myocardial infarction, heart fallure, cardiomyopathy, myocardial

reperfusion injury, and hypertensive heart disease, insulin-dependent,

creperfusion injury, and hypertensive heart disease, insulin-dependent,

diabetes mellitus, lupus, pernicious anaemia, dermatomyositis, enythema

condosum, Sjogene's syndrome, temporal arthritis, myasthenia gravie,

wegener's granulomatosis, glomerulomephritis, anti-phospholipid syndrome,

cand autoimmune polyarthritides), a neoplastic disorder (e.g. leukemia,

csarcomas, myedomas, cardiomomas, melanoma, cancers of the

breast, brain, colon, cervix, and prostate, Hodgkin's disease and

chor-Hodgkin's lymphoma), inflammatory disorders (e.g. inflammatory joint

disorders and inflammatory induced cell damage to the eye, brain and

New peptides obtained from streptokinase, useful in ameliorating cell death due to apoptosis and/or necrosis and treating neurodegenerative, neoplastic, immune, cardiovascular and inflammatory disorders

```
The invention relates to an isolated peptide obtained from streptokinase, or its derivative or analog, which ameliorate cell death. The activity of peptides of the invention may be described as a noctropic, neuroprotective, antiparkinsonian, anticonvulsant, cytostatic, antinflammatory, antiparkristic, antirheumatic, cardiant, antinflammatory, antiparkristic, immunosuppressive, anti-HIV decreated particulabetic, antianemic, virucide, ophthalmological, antiulcer, antibacterial and antiparasitic. Peptides of the invention ameliorates apoptosis and necrosis in a warm-blooded animal. Compositions comprising peptides of the invention are useful for treating neurodegenerative diseases (e.g. perkinson's, Alzheimer's, Huntington's disease and cerebellar degeneration) neoplastic disorders including cancer, inflammatory disorders (e.g. archritis, inflammatory joint calsorders), cardiovascular diseases (e.g. pheat fallure, atherosclerosis and myocardial reperfusion injury), immune diseases (e.g. autoimmune diseases (e.g. autoimmune diseases (e.g. autoimmune diseases), and myocardial reperfusion injury), immune diseases (e.g. autoimmune diseases (e.g. autoimune diseases en diseases (e.g. autoimune diseases en diseases of any organ. Other disorders include macular degenerative diseases of any organ. Other disorders include macular degenerative diseases of any organ. Other disorders include macular degenerative diseases and diseases including bacteria, parasite, prion-based diseases, and accelerated aging. The current sequence represents a streptokinase disease, including contents and with an ability to ameliorate cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            death in cardiac myocytes.

New peptides obtained from streptokinase, useful in ameliorating cell death due to apoptosis and/or necrosis and treating neurodegenerative, neoplastic, immune, cardiovascular and inflammatory disorders

Claim 7; Column 5; 18pp; English.

peptides of the invention may be described as, mostropic, concurrent of may be described as, mostropic, antinflammatory, antiparkinsonian, anticonvulsant, cytostatic, antinflammatory, antiarthritic, antirheumatic, cardiant, contrained antiarthritic, antiaressive, anti-MIV dermatological, antidiabetic, antianaemic, virucide, ophthalmological, antidiabetic, antianaemic, virucide, ophthalmological, antidiabetic, antianaemic, peptides of the invention ameliorates apoptosis and necrosis in a warm-blooded animal. Compositions comprising peptides of the invention are useful for treating comprising peptides of the invention are useful for treating concurrents inflammatory disorders (e.g. heart is, Huntington's disease and cerebellar degeneration) neoplastic disorders including cancer: inflammatory disorders (e.g. heart failure, atherosclerosis and myocardial reperfusion injury), immune diseases (e.g. autoimmune conservation injury), immune diseases (e.g. autoimmune systemic lupus erythematosus, diabetes mellitus, permicious anaemia), myolodegenerative diseases, viral diseases, and degenerative diseases of myorden contrain, and diseases, undertained in parafic myorders, and edgenerative diseases, viral diseases, and degenerative diseases, contrained in parafic manning manning manning manning manning and mine contrains and manning and mine contrains contrains parafacts, and degenerative diseases. The invention relates to an isolated peptide obtained from streptokinase, or its derivative or analog, which ameliorate cell death. The activity of peptides of the invention may be described as, nootropic, diseases including bacteria, parasite, prion-based diseases, and accelerated aging. The current sequence represents a streptokinase derived peptide of the invention with an ability to ameliorate cell death in cardiac myocytes.

New peptides obtained from streptokinase, useful in ameliorating cell death due to apoptosis and/or necrosis and treating neurodegenerative, neoplastic, immune, cardiovascular and inflammatory disorders

```
The invention relates to an isolated peptide obtained from streptokinase, or its derivative or analog, which ameliorate cell death. The activity of peptides of the invention may be described as, nootropic, neuroprotective, antiparkinsonian, anticonvulsant, cytostatic, antinflammatory, antiparkinsonian, anticonvulsant, cytostatic, antinatherosclerotic, vasotropic, immunosuppressive, anti-HIV, cantidiabetic, antianaemic, virucide, ophthalmological, antidiabetic, antianaemic, virucide, ophthalmological, antidiabetic, antianaemic, virucide, ophthalmological, antidiabetic, antianaemic, virucide, ophthalmological, antidiacers apoptosis and antiparasitic. Peptides of the invention ameliorates apoptosis and necrosis in a warm-blooded animal. Compositions comprising peptides of the invention are useful for treating comprising peptides of the invention neoplastic disorders including cancer, inflammatory disorders (e.g. heart failure, atherosclerosis disorders), cardiovascular diseases (e.g. heart failure, atherosclerosis and myocardial reperfusion injury), immune diseases (e.g. autoimmune cy systemic lugue erythematosus, diabetes mellitus, pernicious anaemia), myelodegenerative diseases, viral diseases, and degenerative diseases of any organ. Other disorders include macular degeneration, cataracts, myelodecrative diseases, viral diseases, and degenerative diseases, uccelerated aging. The current sequence represents a streptokinase collerated aging. The current sequence represents a streptokinase collerative diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ..

```

```
The invention relates to a pharmaceutical composition, which comprises a peptide capable of ameliorating cell death, its derivative or analogue, comprising a sequence Val-Asp-Val, where the peptide is in a suitable paramaceutical carrier or diluent. The pharmaceutical composition composition is a sequence of comprising the peptide) is useful for treating or preventing cell death associated with a neurodegenerative disorder e.g. Parkinson's disease and Alzheimer's disease, cardiovascular disease e.g. Parkinson's disease and Alzheimer's neoplastic disorders e.g. leuksemia and carrinoma; inflammatory disorder e.g. arthritis and inflammatory induced cell damage; disease caused by physical insult e.g. trauma and severe shock; inflammatory disorder e.g. arthritis and inflammatory induced cell caperfusion injury; toxic insult e.g. myocardial ischaemia and spinal cord reperfusion injury e.g. myocardial ischaemia and spinal cord controlly spinal cord disease e.g. motor neuron disease and Guillain-Bare syndrome; procedures associated with cell death e.g. bypass surgery and chemotherapy; viral disease e.g. hepatitis and viral encephalitis; infectious diseases e.g. hepatitis and viral encephalitis; clohn's disease; allocatarive colitis; accelerated aging and oxidative stress in a warm-binare fegence as a gener persents sequence represents the amino acid sequence as a gener peptide capable of ameliorating cell death which is based on a contract.
                                                                                                                                                                                                                                                      Pharmaceutical composition for treating e.g. neurodegenerative disorder, cardiovascular disease, neoplastic disorder, viral disease and immune diseases, comprises a peptide capable of ameliorating cell
                                                                                                                                                                                                                                                                                                                                                                                                       Claim 2; Page 3; 19pp; English.

Rabkin SW: Krystal G,

Peptides that ameliorate cell death useful for treating conditions associated with cellular differentiation

Claim 8; Column 12; 15pp; English

AAY25009-Y25019 are novel peptides derived from streptokinase that

ameliorate cell death. The products of the invention and their encoding

nucleic acids may be useful for treating diseases and conditions related

to aging, cellular differentiation, physical insult (e.g. physical

to aging, cellular differentiation, physical insult (e.g. physical

conditions and creams to the brain, spinal cord, kidney, heart, lungs, liver, skin

and treams to the brain, spinal cord, kidney, heart, lungs, liver, skin

cand any other organ), viral disorders (e.g. hepatitis, retroviral

infections, viral encephalitis, and AlbS/HIV), neurodegenerative

disease, cerebellar degenerations, and familial amyotrophic lateral

cc disorders (e.g. Parkinson's disease, Alzheimer's disease, Huntington's

disease, cerebellar degenerations, and familial amyotrophic lateral

cc disorders (FALS)), cardiovascular disease (e.g. atherosclerosis

myocardial infarction, heart failure, cardiomyopathy, myocardial

repertusion injury, and hypertensive heart disease, insulin-dependent,

cdiabetes mellitus, lupus, pernicious aneemia dermatomyositis, enythema

codosum, Sjogrem's syndrome, temporal arthritis, mysethenia gravis,

repenters mellitus, lupus, pernicious aneemia dermatomyositis, enythema

cc diabetes mellitus, lupus, pernicious aneemia, engeres of the

codosum, Sjogrem's syndrome, temporal arthritis, mysethenia gravis,

resence, myslomas, carcinomas, neuromas, melanoma, cancers of the

cc arcomas, myslomas, inflammatory disorders (e.g. inflammatory disorders and inflammatory induced cell damage to the eye, brain and

cother organs, issummatory induced cell damage to the eye, brain and

cother organs, issummatory induced cell damage to the eye, brain and

cother organs, issummatory induced cell damage to the eye, brain and

cother organs, issummatory induced cell damage to the eye, brain and

cother organs, issummatory induced cell damage to the eye, brain and

corgans from chemicals, retained aging, spinal cord issummatory degeneration, catarac and demyelinating disease), bypass surgery, chemotherapy, chemically-induced reperfusion, and therapeutics such as clozapine, AZT, and anthracyclines.

The activity of peptides of the invention may be described as noctropic, neuroprotective, antiparkinsoniah, anticonvulsant, cytostatic, neuroprotective, antiparkinsoniah, anticonvulsant, cytostatic, antinflammatory, antiarthritic, anticonvulsant, cytostatic, antinflammatory, antiarthritic, antinnosuppressive, anti-HIV, dermatclogical, antidiabetic, immunosuppressive, anti-HIV, dermatclogical, antidiabetic, immunosuppressive, anti-HIV, antidiabetic, antiparasitic. Peptides of the invention of antiporates apportosis and necrosis in a warm-blooded animal. Compositions comprising peptides of the invention are useful for treating neurodegenerative diseases (e.g. Parkinson's, Alzheimer's, Huntington's comprising peptides of the invention are useful for treating neurodegenerative diseases (e.g. arthritis, inflammatory joint disorders), cardiovascular diseases (e.g. arthritis, inflammatory joint disorders), cardiovascular diseases (e.g. arthritis, inflammatory disorders injury), immune diseases (e.g. autroimmune diseases, viral diseases, and degenerative diseases of my organ. Other disorders include macular degenerative diseases, of supported inmunodeficiency syndrome (Alba), rheumatorid arthritis, my organ. Other diseases, viral diseases, and degenerative diseases of croh's disease, ulcerative, cataracts, panoreatitis, infectious diseases, and diseases, and descreation, cataracts, and croh's disease, and descreation, cataracts, and croh's diseases, and degenerative diseases, and descreation, cataracts, and croh's diseases, and descreation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Streptokinase, cell death, apoptosis, necrosis, nootropic, neuroprotective, antiparkinsonian; anticonvulsant; cytostatic; antiantiantlammatory; antiarknistic; anticheuvalsant; cardiant; crimation antiatherosclerotic; vasotropic; immunosuppressive, anti-HTV; dermatological; antidabetic; immunosuppressive, anti-HTV; contidation antidabetic; antianammic; virucide; ophthalmological; continucer; antibacterial; antiparasitic; neurodegenerative disease; continucer; antibacterial; antiparasitic; neurodegenerative disease; crebellar degeneration; neoplastic disorder; cancer; inflammatory disorder; arthritis; inflammatory joint disorders; cardiovascular disease; heart failure; atherosclerosis; myocardial reperfusion injury; immune disease; autoimmune disease; cardiovascular disease; heart failure; atherosclerosis; cardiovascular continucersus; diabetes mellitus; pernicious anaemia; myelodegenerative diseases; viral diseases; macular degeneration;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New peptides obtained from streptokinase, useful in ameliorating cell death due to apoptosis and/or necrosis and treating neurodegenerative, neoplastic, immune, cardiovascular and inflammatory disorders
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   cataract; Crohn's disease; ulcerative colitis; pancreatitis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     (MOLE-) MOLECULAR THERAPEUTICS INC.

The specification describes a polypeptide which binds to a streptokinase-specific antibody and prevents the antibody binding to native streptokinase. The specification also describes a synthetic polypeptide (PI) comprising an epitope which binds to an streptokinase-specific antibody and reduces thrombolytic activity of streptokinase. Pl is used in thrombolytic therapy, and to

The present invention describes an isolated bacterial protein that induces fibrin-dependent plasminogen activation in a pharmaceutical composition for dissolving blood clots. Also described are: (1) a composition comprising an isolated modified streptokinase, the modification being removal of animo acid residues in the amino terminus; (2) a method for dissolving a blood clot in a subject, comprising comprising to the subject a fibrin-dependent streptokinase; (3) an ancleic acid (1) encoding a modified bacterial streptokinase; (3) an expression vector comprising (1), and (4) a host cell transformed with the expression vector of (3). The pharmaceutical composition comprising a bacterial fibrin-dependent plasminogen activator is useful for a bacterial fibrin-dependent plasminogen activator is useful for composition, venous thrombosis, pulmonary embolism, cerebral thrombosis, graft thrombosis and arterial brombosis. The modified streptokinase can also be used in non-human mammals. Streptokinase cutivation of plasminogen is at least 10-fold, preferably 100-fold greater in the presence of fibrin than in the absence of fibrin. The compilied streptokinase has at least one amino acid substitution that in activates a substrate site for proteolytic cleavage. This reduces the inactivates a substrate site for proteolytic cleavage. This reduces the sequence represents recombinant streptokinase, designated rSK144-293.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Antigenic peptide, streptokinase, streptokinase-specific antibody, thrombolytic activity, thrombolytic therapy, glomerulonephritis,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          .

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          °,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present sequence represents a peptide corresponding to amino acids 148-293 of streptokinase. The specification describes a polypeptide which binds to a streptokinase-specific antibody and prevents the antibody binding to native streptokinase. The specification also describes a synthetic polypeptide (P1) comprising an epitope which binds to an streptokinase-specific antibody and reduces thrombolytic activity of streptokinase. P1 is used in thrombolytic therapy, and to prevent or treat glomerulonephritis and rheumatic fever.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Streptococcus; streptokinase; fibrin-dependent plasminogen activator; nSK; rSK; bacterial; blood clot; thrombotic condition; myocardial infarction; venous thrombosis; pulmonary embolism; cerebral thrombosis; graft thrombosis; arterial thrombosis.

Streptokinase derivative having a C-terminal deletion (i.e. Pro 373-Lys 414) and Arg 45 to Gly 68 also being deleted. Derivatives show a decreased antigenicity, higher stability in blood and greater selectivity of thrombolytic activity and specificity. The protein is used a thrombolytic agent in patients with lung thrombus or myocardial infarction. See also AAQ10230, AAR10195 and AAR10197-R10200.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Synthetic gene encoding streptokinase - scale, high purity prodn.

                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                      The present sequence represents a peptide corresponding to amino acids 120-352 of streptokinase. The specification describes a polypeptide which binds to a streptokinase-pecific antibody and prevents the antibody binding to native streptokinase. The specification also describes a synthetic polypeptide (P1) comprising an epitope which binds to an streptokinase-specific antibody and reduces thrombolytic activity of streptokinase. Pl is used in thrombolytic therapy, and to prevent or treat glomerulonephritis and rheumatic fever.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present sequence is that of streptokinase encoded by a pST-1 HindIII fragment. Recombinant streptokinase can be produced by culturing bacteria transformed with a high efficiency plasmid contg. the streptokinase gene, amplified by using haemolytic Streptococcus as the template and using inducers based on the streptokinase nucleotide sequence. The recombinant streptokinase is used to treat thrombotic

The sequence was deduced from DNA obtd. from PCR amplified chromosomal DNA from S. equisimilis (Lancefield's Gp C ) ATCC 10009 or ATCC 9642.

ATCC 9642.

The gene was truncated by 15 codons at the 3' terminal and engineered to add a Met codon prior to codon 16 of the streptokinase CDS. The construct was used to prepare expression vector p6G606 for prodn. of the streptokinase core molecule.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention describes an isolated bacterial protein that induces fibrin-dependent plasminogen activation in a pharmaceutical composition for dissolving blood clots. Also described are: (1) a composition comprising an isolated modified streptokinase, the modification being removal of amino acid residues in the amino terminus; (2) a method for dissolving a blood clot in a subject, comprising administering to the subject a fibrin-dependent streptokinase protein; a nucleic acid (1) encoding a modified bacterial streptokinase protein; a nucleic acid (1) encoding a modified bacterial streptokinase protein; a bacterial fibrin-dependent plasminogen activator is useful for the expression vector comprising (1); and (4) a host cell transformed with the expression vector of (3). The pharmaceutical composition comprising a bacterial fibrin-dependent plasminogen activator is useful for a bacterial infarction, venous thrombosis, pulmonary embolism, cerebral thrombosis, graft thrombosis and arterial thrombosis. The modified streptokinase can also be used in non-human mammals. Streptokinase activation of plasminogen is at least lofold, preferably 100-fold greater in the presence of fibrin than in the absence of fibrin. The modified streptokinase has at least one amino acid substitution that inactivates a substrate site for proteolytic cleavage. This reduces the rate of degradation of the streptokinase at least two-fold. The present sequence represents recombinant streptokinase at least two-fold. The present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö

256 and 257. Derivatives show a decreased antigenicity, higher stability in blood and greater selectivity of thrombolytic activity and specificity. The protein is used as a thrombolytic agent in patients with lung thrombus or myocardial infarction. See also AAQ10230, AAR10195-6 and AAR10198-R10200.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Streptokinase derivative having a C-terminal deletion (i.e. Pro 373-lys 414) and retaining streptokinase activity. One or more of the amino acids can be replaced by a different amino acid at the same position or it can be deleted. Alternatively, an extra residue can be inserted into the sequence. Derivatives show a decreased antigenicity, higher stability in blood and greater selectivity of thrombolytic activity and specificity. The protein is used as a thrombolytic agent in Selectivity and thrombus or myocardial infarction. See also AAQ10230 and AAR10195-R10199.
